

Definition of Done (DoD)

StreamLine Retail - Mobile Rebuild Project

This document defines the mandatory quality standards for the StreamLine Retail mobile application. No User Story is considered "Done" until all applicable criteria below are satisfied and verified.

1. Development & Code Health

Peer Code Review

Why: Avoids knowledge silos and ensures that at least two people understand the logic. Prevents "quick fixes" that break architecture.

Unit Test Coverage (80%+)

Why: Provides a safety net for future changes. If logic changes, unit tests catch immediate side effects.

Static Analysis Compliance

Why: Automatically catches common security flaws and code smells before they reach QA.

2. Testing & Quality Assurance (The QA Gate)

Automated Regression Suite Passed

Why: Direct fix for "Frequent Regressions." Automation ensures that old features (like Barcode Scanning) don't break when adding new ones.

Physical Device Testing (iOS & Android)

Why: Simulators don't reveal camera focus issues for barcodes or network latency during offline/online transitions.

Performance Baseline Met

Why: Retail managers need efficiency. We must verify that sales processing and dashboard loading are under the agreed time limits.

3. Security & Integration

Secure API Integration & Encryption

Why: Prevents major vulnerabilities. Ensures inventory and sales data are encrypted during transit and while stored locally (Offline Mode).

Integration Testing Completed

Why: Verifies that the mobile app communicates correctly with the backend, preventing data sync errors.

4. Documentation & UX

Technical Wiki & Swagger Updated

Why: Solves "Unclear Documentation." Ensures the team and clients have a clear operational understanding of the solution.

UX/UI Sign-off

Why: Ensures the redesign goals are met and the interface is consistent across all features.
